# EVB-CQB150-300S Series Application Note V11

## 1. Introduction

The EVB-CQB150-300S is the evaluation board for testing CQB150-300SXX series. It has a (2:1) input voltage range of 180 to 425VDC. For help in testing the performance of DC-DC converters, please refer to the [CQB150-300S application note](#).

### Shock Warning:

Certain areas of the evaluation board are exposed to high voltage. Be careful to avoid contact with these voltages. After disconnecting the input power, the evaluation board may temporarily maintain high voltage. Be careful when handling.

### Application of Input Power:

The evaluation board **prohibits hot plugging**. So **don't use** a knife switch or circuit breaker to connect the input power. This type of action applies the input voltage at an uncontrolled very high rate of rise (dV/dt), which may damage the converter and external components before the converter. The input voltage should be applied at a controlled rate of rise (recommend 10V/uS). Also, before inserting or removing the converter module from the evaluation board, make sure that the input voltage is turned off.

### Thermal Considerations:

When testing the converter on the evaluation board, ensure adequate cooling. Use a fan to blow the cooling air so that the fan blows through the converter or the radiator connected to the converter. The converter temperature to ensure that it does not exceed the maximum rated temperature specified in the data sheet.

### Sockets of DC DC Converter:

The evaluation board uses sockets to provide options for testing different converters. These sockets are not suitable for continuous high current. Short-term testing is possible, but please be aware of this limitation of long-term testing. The socket will add resistance in the power loop, which will cause a voltage drop at higher currents, which can cause significant errors in regulation and efficiency measurements. These socket also do not provide a thermal cooling path from the module pins to the PCB wiring, which may cause higher converter temperatures and errors when performing thermal evaluation. For long-term testing, thermal testing and permanent installation, it is recommended to use soldered connections.

## 2. Pin Function Description Input and Output Connections

No	CN101&CN202	Description	No	CN201	Description
1	+V Input	Positive Supply Input	1	-V Output	Negative Power Output
2	-V Input	Negative Supply Input	2	-Sense	Negative Output Remote Sense
3	Remote	External Remote On/Off Control	3	+Sense	Positive Output Remote Sense
4	Case	Connected to DC Module Case	4	+V Output	Positive Power Output
5	+V Output	Positive Power Output			
6	+V Output	Positive Power Output			
7	-V Output	Negative Power Output			
8	-V Output	Negative Power Output			

Note: DC module Case can be connected to PCB through M3 threaded mounting insert. Recommended torque 3Kgf-cm.

## 3. Output Remote Sense, Trim Resistors

### 3.1 Output Remote Sensing

The CQB150-300S series converter has the capability to remotely sense both lines of its output. This feature moves the effective output voltage regulation point from the output of the unit to the point of connection of the remote sense pins. This feature automatically adjusts the real output voltage of the EVB-CQB150-300S series in order to compensate for voltage drops during distribution and maintain a regulated voltage at the point of load. The remote-sense voltage range please refer to the [CQB150-300S application note](#).

When remote sensing is used, please remove the jumper of CN201 and the sense should be connected by twisted-pair wire or shield wire. If the sensing patterns short, heavy current flows and the pattern may be damaged. Output voltage might become unstable because of impedance of wiring and load condition when length of wire is exceeding 400mm. This is shown in the schematic below.

When the EVB-CQB150-300S was shipped from a factory, they come with JP1 and JP2 placed on CN201. If the remote sense feature is not to be used, the sense JP1 and JP2 should be connected locally.

**Note:**

Although the output voltage can be varied (increased or decreased) by both remote sense and trim, the maximum variation for the output voltage is the larger of the two values not the sum of the values. The output power delivered by the module is defined as the voltage at the output terminals multiplied by the output current. Using remote sense and trim can cause the output voltage to increase and consequently increase the power output of the module if output current remains unchanged. Always ensure that the output power of the module remains at or below the maximum rated power. Also be aware that if  $V_{o\_set}$  is below nominal value,  $P_{out\_max}$  will also decrease accordingly because  $I_{o\_max}$  is an absolute limit. Thus,  $P_{out\_max} = V_{o\_set} \times I_{o\_max}$  is also an absolute limit.

### 3.2 Output Voltage Adjustment

EVB-CQB150-300S is shipped without trim resistor for output voltage adjustment, output voltage can be adjusted by external variable resistor (adjustment range: please refer to the [CQB150-300S application note](#)).

**Note:**

**Description of Trim Resistors**

Fixed resistor R201 and R205 are used to adjust down the output voltage set-point of the converter.

Fixed resistor R202 and R204 are used to adjust up the output voltage set-point of the converter.

The trim resistors R201, R202, R204, R205 and VR are not populated in this evaluation board. This is to allow the user to determine and install the needed trim resistance values based on the range of desired output voltage adjustment of the module being evaluated.
